Ikke mullaer denne gangen, men kjemisk helsefare..

Interpellasjon fra André N. Skjelstad (V) til arbeids- og inkluderingsministeren

Halvor Erikstein NMF årskonferanse 2007

Datert: 18.06.2007

Besvart: 08.10.2007 av arbeids- og inkluderingsminister Bjarne Håkon Hanssen (A)

Referat

I den senere tid har vi sett en rekke saker hvor det er knyttet alvorlig mangler til håndtering av kjemikalier på arbeidsplasser. Det har vært en lang rekke tilfeller av yrkesskader knyttet til kjemikalier og det avdekkes stadig nye områder hvor det er sannsynlighet for at kjemikaliebruk på arbeidsplassen har medført varige helseskader. Helseskader knyttet til kjemikaliebruk kan derfor være undervurdert. Trolig er en del arbeidsplasser preget av en arbeidskultur som i for liten grad tar hensyn til helsefarene knyttet til stoffene som håndteres. Alvorlig miljøskade kan også oppstå dersom kjemikalier ikke håndteres på riktig måte. Bedre informasjon om skadevirkninger knyttet til bruk av kjemikalier kan være en måte å forbedre håndteringen på arbeidsplassene. Hva vil statsråden gjøre for å sikre at norske arbeidsplasser bedre håndterer kjemikalier og i større grad forhindrer helseskader?

DOK 8 forslag

(Dagbladet.no:)

Venstrerepresentantene Gunnar Kvasheim, Gunvald Ludvigsen og André N. Skjelstad leverer over helga et såkalt dokument 8-forslag til Stortinget.

«Det avdekkes stadig nye områder hvor det er sannsynlighet for at kjemikaliebruk på arbeidsplassen har medført varige helseskader (...) Stortinget ber regjeringen opprette et Nasjonalt kompetansesenter med kjemikalieskade og forskning som hovedanliggende,» heter det i forslaget.

- Viktig å være på alerten

Venstre mener at et slikt senter kan motvirke helseskade knyttet til kjemikaliebruk.

- De arbeidsmedisinske avdelingene sitter på mye kompetanse, men vi oppfatter

FORSLAGSSTILLER: Venstrepolitiker André N. Skjelstad vil at Stortinget skal opprette et nasjonalt kompetansesenter for kjemikalieskader.

Finger Prints

THERE is no cause for worry when fingerprint smudges or dirt spots appear on a wall painted with Dutch Boy white-lead. A little soap and water will remove them easily without harming the paint or marring the beauty of the finish. Painted walls are sanitary, cheerful and bright.

We carry a complete line of painting supplies including Dutch Boy white-lead, linseed oil, flattening oil, brushes and all other accessories.

Visit our store and let us help you plan your home decoration.

--	---	--	---	--

* Add $\frac{1}{2}$ pint drier to each gallon of paint if raw linseed oil is used. Boiled oil requires no drier.

When you want to get the most for the money you spend on interior paint, don't ask "Is this paint durable?" Say, "Is it really washable?" Durability alone is not enough. You have probably had many experiences with paint that didn't wear off but from which marks and smudges wouldn't wash off. So re-painting time came much sooner than was expected.

Flat paint made with Dutch Boy White-Lead and Dutch Boy Lead Mixing Oil has all the durability for which white-lead is famous. In addition, this paint is in the full sense of the word, its beauty is not impaired by hard scrubbing. These scrubbing really get you somewhere. Stubborn stains and dirt actually do "come out in the wash".

For proof, take a look at the test panel above. It was walked on for a week. Then it was saturated with

grease, stained with mercury-chromium, streaked with pencil, crayon and lipstick, dabbed with shoe blacking. *But despite this hard treatment, washing with soap and water left the panel looking as clean as when first painted.*

Now consider briefly this paint's many other advantages. It has all white-lead's characteristic richness, solidity and depth, a point of unusual beauty. Because of its excellent sealing power, it stops suction and hides fire cracks.

Finally, this paint gives you all-

round economy. It has high coverage (1000 sq. ft. per gal. on smooth plaster), mixes quickly, spreads easily. Add up those three qualities, and you have far first cost. Then add long wear and real cleanliness, and you have low cost per year.

The Drop of Solder...

that puts a Cow in your Kitchen Cupboard

What's the final step in preserving the purity of the condensed or evaporated milk that you feed to babies?

It's a little drop of solder... that seals the tin fast through which the air can be filed.

Solder, too, is the vital little that helps keep tin containers from "leaking at the seams"... an amazing servant in bringing the farm to your kitchen, the oil fields to your car.

In fact, much of the modern world as you know it today would "fall apart" but for this man-made metal alloy. Electric power, from the largest to the smallest generator, would be in vain. Motors, trains and ships would stop. Household appliances would not work. Automobiles for the most part would fail. All communication by radio, telegraph and telephone would be stifled.

As an example, when you dial a phone number over an automatic exchange, your personal mes-

sage passes through no fewer than 2000 soldered connections joining the maze of wires in intricate equipment. And they must be "good connections." That's why they're soldered... and why good solder must be used.

For, while you have found an convenient substitute for solder since its first use—used only in tin cans—there is no better solder, and only one many different solders needed to do today's amazing jobs, and the indispensable factors of such are their absolute purity and fitness for the work at hand.

There, each widely differing use—ranging from the largest to the smallest—requires highly refined solders. And methods of application range all the way from the familiar hand soldering iron to automatic, electrical heat induction.

Typical important and varied are the special "brass" needed to help clean the surfaces to be joined and make the solder cling.

That's why National Lead's extensive experience with solder and fluxes for every use in such great assurance to industry of well-soldered jobs. It has resulted in a broad line, including Dutch Boy Solder and "Noble" Fluxes, as well as specialty products such as "Fluxite", described at the lower left.

Whatever your industrial soldering needs, National Lead invites your inquiry. This one organization can supply not only the proper solder in the most efficient form and size—as well as the ideal flux to go with it—but also expert advice on the method to be used. Address National Lead Company, 111 Broadway, New York 6, N. Y.

NATIONAL LEAD Company
a great name in SOLDER and many other products

"Messy, smelly, and often of Lead, stay out of your eyes... Many factories of Lead, tin, zinc, brass and other alloys; also lead, lead pipe, solder, paint, etc. and other lead products; non-ferrous alloys; oil well drilling and machinery; and machinery equipment."

16. The drop of solder. Even after World War II, lead was promoted as a boon to children. Here, National Lead tells parents that lead solder is not a problem even in canning evaporated milk meant for babies. Source: *Saturday Evening Post* (February 23, 1946), 59.

Mixtures of substances in the workplace: utility for evaluating the chemical risk (Calculation of the Rm)

○○○ Utility

Exposure to mixtures of chemical substances in the workplace raises questions. Organizations such as the ACGIH® in its Chemical Substance TLV® Committee and much legislation make the recommendation that the presence of all the contaminants that have similar effects on the same organs or systems of the human body be taken into account. In this case, it is recommended that the exposures be added rather than considered individually... unless it is established otherwise... the interactions must then be taken into account (synergy, potentiation, antagonism...).

The utility that you are preparing to use integrates the results of a research project on toxicological interactions. The project was carried out in 2 phases and the reports are available on the IRSST's Web site : ([Phase 1](#) et [Phase 2](#)).

Disclaimer

This utility is an aid in decision-making made available to occupational health professionals. It informs them about the additivity or interaction potential between chemical substances in a mixture found in the workplace. *It cannot replace the informed judgement of an occupational health professional.*

GCAQE

[home](#)[about](#)[media](#)[contact](#)

» Welcome!

The Global Cabin Air Quality Executive (GCAQE) is the leading organization globally representing air crew with regard to cabin air quality, specifically contaminated air issues and representing over 400,000 aviation workers globally in 3 continents.

GCAQE members have been actively involved in working with crews, global experts, scientists, doctors and the aviation industry for many years on this subject, including being members of several international committees such as the FAA OHCRA project, ITF, SAE and ASHRAE committees.

SPECIAL INVESTIGATION

AIR SICKNESS

- Passengers, crew exposed to toxic fumes from engines
- Qantas flight engineer falls ill as gas engulfs cabin

By **MATTHEW BENNS**

FLIGHT crews have been overcome by toxic fumes on Australian jets, the latest on a Qantas flight from Los Angeles to Auckland.

Senior pilots warn that crew and regular passengers could suffer serious long-term illnesses unless the aviation industry admits jet airliners worldwide have a critical design flaw.

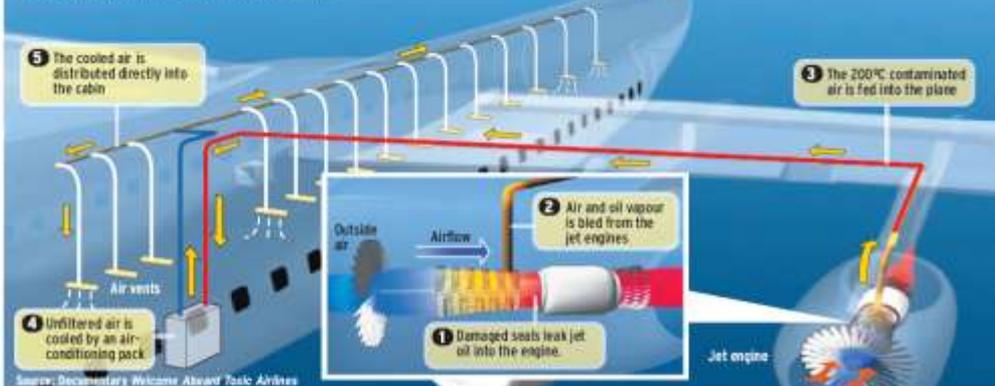

A Qantas flight engineer was off work for a week after inhaling toxic fumes on the flight deck of a Boeing 747 flying from Los Angeles to Auckland in July. WorkCover in NSW issued an improvement order telling the airline to address the problem.

But *The Sun-Herald* can reveal it was not a one-off incident, and that flight crews fear there would be "a disaster" if both pilots were overcome by fumes during a flight.

Australian & International Pilots Association general manager Peter Somerville said: "People don't need to stop flying but there is a problem and it needs to be fixed."

The problem stems from a con-

Toxic planes: what the airlines don't tell you

May 27, 2007

Reporter : [Ross Coulthart](#)

Watch video

Few of us give much thought to the air we breathe when we fly on a passenger jet aircraft. But when you think about it, there's something quite miraculous about sitting in comfort in a pressurised aluminium tube at 8000 metres, when outside it's about minus 55°C and the atmospheric pressure is about one-fifth that at ground level.

For about 50 years one of the technologies that has made international jet travel possible is the bleed air pressurisation — which draws hot air out of the engine, cools it down, and then ducts it into the plane cabin and cockpit.

Before it was introduced, planes flying at high altitude, such as the bomber pilots flying over Europe during World War II, had to wear oxygen masks and endure often freezing temperatures inside their cockpit. The B29 Superfortress bomber ushered in bleed air pressurisation, using the compressors in the engines to duct warm air into the cockpit. The Lockheed Constellation aircraft followed post-war and the rest is history.

But eight years ago, during a Senate inquiry in the Australian Parliament, the then head of Australia's air safety watchdog, the Civil Aviation Safety Authority (CASA), conceded what many flight crew have known for decades: that on occasion these bleed air systems can be contaminated with oil that leaks into the cabin air from the engines.

And, as also came out of that inquiry, the jet oil most commonly used in commercial aviation contains a number of nasties — including an organophosphate called tricresyl phosphate (TCP), which is a known neurotoxin. TCP is by no means the only compound that can potentially cause fumes in passenger jet air, but it is the most concerning because of the symptoms the scientists say it can cause: headaches, nausea, dizziness, loss of concentration, blurred vision, temporary paralysis and long-term neurological damage, chronic fatigue and chemical sensitivity.

Vision. Value. Impact.

Three small words mark the theme for the 2008 AiHce. Three small words that have the weight of significant meaning for OHS professionals today and in the future.

Vision. We value and aspire to be visionaries. Visionaries help us see things in a new light or a new angle, taking what we already think we know to be true but then revealing a new layer. Visionaries move the profession forward by having the foresight to anticipate the issues of tomorrow.

Value. OHS professionals provide value to employers, the public, and many other groups. The task of proving that value will be a main focus of keeping the profession vital and growing. AiHce 2008 will be the forum for the diverse disciplines within the profession to come together to discuss their value and learn from each other's experience.

Impact. The ultimate and desired endpoint of vision and value is to have a positive impact. What impact will you have on the work force, your employer, your profession, your society, your life? Will you step up and be a visionary to help others learn about current issues and the impact they will have on the future?

AiHce 2008. Inspire vision! Provide value. Create a positive impact!

Mark your calendars!
AiHce 2008
Vision. Value. Impact.
